

SPT TarkovAssortBuilder Instructions

This utility will take a very simple item helper file and convert it to full assort.

1. Create your item helper file. The item helper file should be formatted like the example below. Each Item you want in your assort.json should be in quotations and contain the “_id” for the desired item you want added to your trader. A very useful resource for this is <https://db.sp-tarkov.com/search>

ITEM HELPER EXAMPLE (NO commas. Left indent. One line per item ID)

- Save as a .json file

```
1 "60098ad7c2240c0fe85c570a"  
2 "590c657e86f77412b013051d"  
3 "60098af40accd37ef2175f27"  
4 "5e8488fa988a8701445df1e4"  
5  
6
```

2. Run TarkovAssortBuilder.exe

3. In the GUI Browse to your existing item helper file that you created in step 1

4. You can enter your own output filename in the “Save As” field or leave it default. Default will add “_assort” to the end of your item helper filename.

5. Select your desired currency from the dropdown. You can select RUB, USD, or EUR.

6. Leave the slider at zero for current Tarkov.dev trader pricing. Drag the slider up for the desired markup, or down for the desired discount.

7. For unmatched items (custom items not in the Tarkov.dev database, or items not allowed on the flea market); select what you want the utility to set for pricing. You can set:

- “Set to zero”

- “Input a default value” (This will put whatever value you enter as the price for all unmatched items.)

- “Leave untouched”

8. Select the Desired Loyalty Level. The option in the dropdown is 1, 2, 3, or 4. This will set the trader loyalty level for all items as defined by your base.json. NOTE: If you want dynamic loyalty levels per item you can go back and set these manually later.

9. Click “Build Assort”

10. You should now see the utility log output on the screen.

11. The file should now be saved in the same directory with the updated filename, or whatever custom Save As location you set in step 4.
